

Mathematical questions and solutions in continuation of the mathematical columns of the Educational times Volume 64

Filesize: 8.88 MB

Reviews

Here is the best publication i have got go through until now. It is actually writter in simple phrases and never hard to understand. I realized this publication from my dad and i suggested this ebook to find out.

(Lorena White)

MATHEMATICAL QUESTIONS AND SOLUTIONS IN CONTINUATION OF THE MATHEMATICAL COLUMNS OF THE EDUCATIONAL TIMES VOLUME 64

To read **Mathematical questions and solutions in continuation of the mathematical columns of the Educational times Volume 64** PDF, you should follow the button under and save the file or have access to other information that are in conjunction with MATHEMATICAL QUESTIONS AND SOLUTIONS IN CONTINUATION OF THE MATHEMATICAL COLUMNS OF THE EDUCATIONAL TIMES VOLUME 64 book.

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 28 pages. Dimensions: 9.7in. x 7.4in. x 0.1in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1896 Excerpt: . . . figure, and (2) the respective probabilities of 0, 1, 2, 3 intersections, if three diagonals are drawn at random. Solution by H. Fortey. (1) In what follows, diagonals are not produced, and intersection means intersection within the polygon. (2) Let the polygon have n sides. Then the number of pairs of intersecting diagonals is C_4 , for each set of 4 angular points gives one pair. But the whole number of diagonals is $n(n-3)$, and the whole number of pairs of diagonals is $\frac{n(n-3)}{2}$; therefore the chance of a random pair intersecting is $\frac{C_4}{\frac{n(n-3)}{2}}$. (3) In dealing with the question of 3 diagonals, let us first include the sides of the polygon amongst the random lines that may be drawn so that 3 random lines are not all (or even any of them) necessarily diagonals. (4) Now the 3 random lines may have their extremities at any 6, 4, or 3 angular points of the polygon, and the types for each number of points when there are 3, 2, or 1 intersections, with the number of cases included in each type, are as follows:--(5) Therefore, if I , be the number of triplets of lines which make p intersections, we see by inspection that $I_3 = C_6 - 3C_5 + 3C_4 - C_3$. (6) But, remembering that both diagonals and sides are included in this calculation, let us see what deduction must be...
